

## ME 5643 MECHATRONICS FINAL PROJECT

### DENSITY METER

**Shing Lik Wong, Yi Hu, and Jasmin Hume**  
**Group 6**

Polytechnic Institute of NYU  
6 Metrotech Center, Brooklyn, NY 11201

# OUTLINE

- Introduction
- Materials and methods
  - Sensors and their calibration
  - Circuitry
  - Program
  - Structure
- Results
- Demonstration

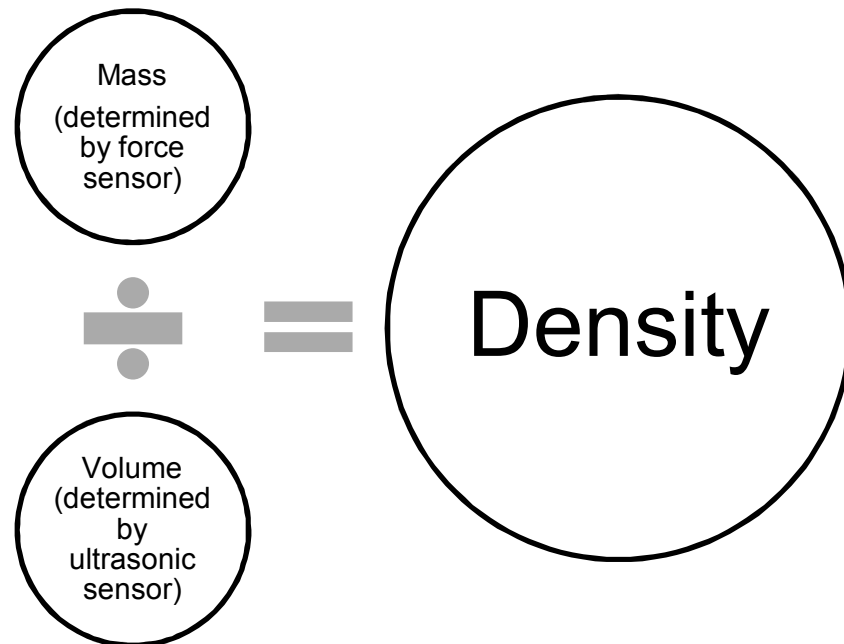

# INTRODUCTION

- Scientific concepts, particularly those related to chemistry and material properties, can be difficult for students to grasp
  - Density is one of the most fundamental material properties to understand
- Hands-on experiments and measurements can make it easier to master difficult scientific concepts and their calculation

- A **density meter** has been designed using the tools of mechatronics to serve as an educational tool to measure:

- Mass
- Volume
- Density

of both liquids and solids

## SENSORS – FORCE SENSOR

- A Tekscan FlexiForce® sensor was chosen to measure the force exerted by the mass of an object
  - A201-25 measures between 0 – 25 lbs
- The sensitive area of the FlexiForce® sensor is composed of two adjacent films of conductive polymer
  - When a force is applied they come in contact, reducing the resistance
  - → the FlexiForce® therefore acts as a *variable resistor*
  - with no load, the sensor has a resistance of  $> 5 \text{ M}\Omega$
  - A maximum load (25 lbs) decreases the resistance to approximately  $5 \text{ k}\Omega$
- The FlexiForce® sensor is interfaced to the BS2 through an RC circuit

# FLEXIFORCE® SENSOR CALIBRATION

- It was necessary to calibrate the FlexiForce® sensor in order to obtain useful information to determine the mass
- RCTime command was used to determine the resistance of the FlexiForce®:

Resistance is non-linearly related to mass

# FLEXIFORCE® SENSOR CALIBRATION

## SENSORS – ULTRASONIC SENSOR

- A PING)))™ ultrasonic sensor is used to measure liquid level
  - Emits a 40 kHz tone and measures the time it takes to receive an echo from an object
  - Range of 2 cm – 3.3 m
- Distance is correlated to travel time of the signal:

$$D = \frac{c \cdot t}{2}$$

**Divided by 2 to account for round trip of signal**

$D$  = distance (cm)  
 $c$  = speed of sound in air at 22 °C (34480 cm/s)  
 $t$  = time (s)

## LIQUID CRYSTAL DISPLAY

- A Parallax 2x16 serial liquid crystal display (LCD) component is used as a user interface

- Displays instructions and measurement results obtained

## DENSITY METER SPECIFICATIONS

- Plexiglas was used to construct the housing for the density meter
  - Assembled with glue
- Overall measurements are:  
20 x 20 x 40 cm
- For measuring *solids*:
  - volume < 600 ml, dimensions < 10 cm
- For measuring *liquids*,
  - 200 ml < volume < 1 l
- Voltage: 4 x 1.5 V batteries
- Accuracy of approximately 10 %

# CIRCUITRY

- Servo motor connected to  $V_{dd}$ ,  $V_{ss}$ , and pin 11
- PING)))™ sensor connected to  $V_{dd}$ ,  $V_{ss}$ , and pin 15
- FlexiForce® sensor connected to  $V_{ss}$  and pin 7
- LCD connected to  $V_{dd}$ ,  $V_{ss}$ , and pin 14
- 2 SPST normally-off buttons connected to pins 0 and 1
- Servo motor, ultrasonic sensor, force sensor, and LCD all interfaced via 3-pin connections

## RESULTS

Material	Actual			Experimental			% <i>error</i>
	Mass (g)	Volume (ml)	Density (g/ml)	Mass (g)	Volume (ml)	Density (g/ml)	
Water	750	750	1.0	582	706	0.8	17.6
500 g weight	500	110	4.5	482	109	4.4	2.7
Average % error =							10.1

- Water, methanol, and several solid samples were measured
- Water had an error of 17.6 %, while a standard weight of 500 g had an error of 2.7 %
  - Average error of approximately 10 % was obtained
- Factors contributing to error include:
  1. Error from FlexiForce® and PING)))™ sensors
  2. Limitations of PBASIC program in calculations

THANK YOU  
FOR YOUR ATTENTION!
