Acid Rain - revised

by

Edwin Yu

Introduction

Factories continuously emit many different gases, such as carbon dioxide (CO₂), sulfur dioxide (SO₂) and nitrogen oxides (NO₂). When such gases react with the water in the atmosphere, acid rain is formed. The normal acidity level of rainfall has a pH of about 5.6, due to the CO₂ in the atmosphere. However, if the rain reacts with high concentration of SO₂ and NO₂, the acidity can drop down to a pH of 2, which is very harmful to the living environment. It kills micro-organisms, poisons plants, and damages metals and limestone. For instance, if the acidity of a lake is pH 4.5, fish may still survive there, however, the fish cannot reproduce. If the pH level of the lake remains at 4.5, once the original fish die, there will be no fish remaining in the lake.

Background

Water will react with different gases to form acids. Some common acids result from the combination of water with CO₂, SO₂, and NO₂. This combination leads to harmful effects for the living environment in which the acid was formed.

When CO₂ reacts with water, carbonic acid is formed.

\[ \text{CO}_2(g) + \text{H}_2\text{O}(l) \rightarrow \text{H}_2\text{CO}_3(aq) \]

When SO₂ reacts with water, sulfurous acid is formed.

\[ \text{SO}_2(g) + \text{H}_2\text{O}(l) \rightarrow \text{H}_2\text{SO}_3(aq) \]

When NO₂ reacts with water, nitric acid is formed.

\[ 2\text{NO}_2(g) + \text{H}_2\text{O}(l) \rightarrow \text{HNO}_2(aq) + \text{HNO}_3(aq) \]
Where: (g) represents the gas state

(l) represents the liquid state

(aq) represents the dissolved state

**Objective**

1. To understand how the pH level of an environment affects living organisms.
2. To understand the relationship between the pH level and CO₂ concentration of distilled water.

**Equipment List**

- Computer
- pH Probe
- Vernier computer interface
- One 100 ml Graduated Cylinders
- Logger Pro Software
- One stirring rod
- Distilled water
- 1 30 ml Beaker
- CO₂ (your breath)
- 1 Straw

**Experimental Procedure**

1. Measure 20 ml of distilled water into a graduated cylinder and pour it into the 30 ml beaker

2. Connect the Vernier computer interface to the computer and connect the pH Probe into Channel of the interface.

3. Run the Logger Pro Software and get ready to collect data by opening the file “Acid Rain” from the Living Environment folder.

4. For each time you use the pH probe, you have to rinse the tip thoroughly with distilled water. When you rinse it, DON’T apply water directly to the tip of the pH probe because the tip of the pH probe is very sensitive. Put it in buffer solution when you are not using it. DON’T let the pH probe dry out. If the probe dries out, it will be damaged and you will have to either buy another or repair it.
5. In the Logger Pro software, a table will appear when you run the program. Label the header of the table by double clicking on the header and typing “Distilled Water” into the window that opens. Put the pH probe into the 30 ml beaker and collect the data by clicking to measure the pH level for 1 minute.

6. When one minute is over, store the collected data by clicking “Store Latest Run” from “Experiment Menu”.

7. Rinse the pH Probe thoroughly and put it back to the buffer solution.

8. Select the data from the graph which is the most constant values part, and then draw the best fit line by clicking to get the general equation of your data. The y-intercept is the average pH, if the slope of the best fit line is very small.

9. Record the general equation of the graph into Table 1.

10. Put a straw into the 30 ml beaker. Collect the data by clicking to measure the pH level while you are blowing your breath into the distilled water.

11. Select the data from the graph, and then draw the best fit line by clicking to get the general equation of your data. Record the maximum and minimum pH level of the distilled water into Table 1.

12. Rinse the pH Probe thoroughly and wash all the equipment using tap water. Put the pH probe back into the buffer.

Analysis

1. What is the reason to measure the pH of distilled water in this experiment?

2. What happened after you blow your breathe into the distilled water? Did it increase or decrease the pH level of the distilled water? Why?

3. Plot a bar graph for each sample using the data from Table 1.
