

# About accuracy and approximation

## Part A: 1 ROTATION

<i>Measure and Calculate</i>	In <b>millimeters</b> (mm)
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Actual</span> length of the line	177
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Measured</span> length of the line	
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Measured</span> - <span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Actual</span>	

Which length is longer Actual or Measured ? \_\_\_\_\_

By how much is your Measured length different from an Actual length? \_\_\_\_\_ (mm) .

How accurate do you think your Measured length is? \_\_\_\_\_

---

## Part B: 2 ROTATIONS

<i>Measure and Calculate</i>	In <b>centimeters</b> (cm)	<b>Round up</b> to the nearest whole number (cm)	<b>Round down</b> to the nearest whole number (cm)
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Actual</span> length of the line	35.4	36	35
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Measured</span> length of the line			
<span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Measured</span> - <span style="border: 1px dashed black; border-radius: 10px; padding: 2px;">Actual</span>			

How accurate do you think your Measured length is? \_\_\_\_\_

---
